AIRMAIL

FBI FILE NO. 95-246207

LAB. NO. 11103049 S QV VB

YOUR NO. B14066

Re: JOHN DOE - VICTIM;
INVESTIGATION/SUICIDE

Bullet Lead-4-95-246207

Examination requested by: Addressee

Reference: Letter dated October 29, 1981

Examination requested: Firearms - Microscopic Analyses

Specimens:

Q1 Cartridge case removed from K1 revolver

Q2-Q7 Six cartridges removed from K1 revolver

Q8 Bag

Q9 Hair

K1 .32 S&W Long caliber Arminius revolver,
Serial Number [redacted] removed from Q8 bag

Result of examination:

Specimen Q1 is a .32 S&W Long caliber cartridge case of Remington-Peters manufacture which was identified as having been fired in the K1 revolver.

Specimens Q2 through Q7 are .32 S&W Long caliber cartridges of Remington-Peters manufacture.

This examination has been made with the understanding that the evidence is connected with an official investigation of a criminal matter and that the Laboratory report will be used for official purposes only, related to the investigation or a subsequent criminal prosecution. Authorization cannot be granted for the use of the Laboratory report in connection with a civil proceeding.

RAC:pac* (4)

MAIL ROOM ☐b6
b7C

FBI/DOJ

The inside and outside of the Q8 bag were microscopically examined and chemically processed for gunpowder and/or gunshot residues. Scattered gunshot residues were detected on the inside of the Q8 bag. This indicates that the muzzle of a weapon was held within the maximum distance at which such residues would be deposited on the inside of the Q8 bag when fired. This maximum distance was determined to be approximately one foot using the K1 revolver and ammunition like that represented by specimens Q1 through Q7.

The K1 revolver functioned normally when test fired in the Laboratory. The single-action trigger pull was determined to be approximately four and one-half pounds and the double-action trigger pull was determined to be approximately sixteen pounds; these are considered to be normal for a weapon such as the K1 revolver. The K1 revolver was tested in the Laboratory to determine if it could be made to fire without pulling the trigger. When tested in the Laboratory the K1 revolver could be made to fire without pulling the trigger in the following ways:

- 1) by striking the hammer sharply from the rear when the hammer was in the forward position.
- 2) by pulling the hammer to the rear to almost a "full-cock" position and releasing the hammer.

Specimen Q9 consists of brown Caucasian head hairs.

The submitted specimens are being returned to your department under separate cover.

Bullet Lead-5-95-246207

b7A

Material submitted consists of one human cranium, mandible and isolated cranial fragments. All bones are very well preserved with some odor and organic debris present. Numerous open chitinous exoskeletons of fly puparia also are present, especially concentrated within the cranial vault. Several light brown hairs also are present on the cranium, the longest measuring 60 mm in length. Small remnants of dessicated soft tissue remain on the right parietal and facial area.

The cranium is largely intact, with a small circular perforation on the right parietal and a larger broken area on the left parietal-temporal area (see discussion under trauma below). Portions of the left inner orbit also are fragmented and missing. The mandible is intact. All permanent teeth are present, but the four third molars, which had been lost long before death. The teeth show relatively little occlusal wear (attrition), and little to no calculus formation. Restorations are present on the occlusal crown of the maxillary left first molar, the occlusal crown of the mandibular right first molar, and the buccal (outside) crown surface of the mandibular left second molar.

Sex: The appearance of the cranium and mandible, especially the large supraorbital ridges, large mastoid processes and robust occipital strongly suggests male sex.

Age at death: The extent of cranial suture closure and dental attrition suggest an age at death probably between 30 and 35 years of age.

Racial affiliation: The following observations all suggest a Caucasian (White) racial affiliation for this cranium and mandible: narrow nasal aperture, sharp nasal spine, receding malars, slight dental overbite, lack of shovel-shaping in the maxillary incisor teeth, very slight alveolar prognathism, and straight brown hair. Note however, that discriminant function analysis of cranial measurements classified the cranium as intermediate between White and Mongoloid, suggesting that the individual may have mixed racial ancestry.

Time since death: Since associated documents suggest that over six years have elapsed between discovery and this examination, it is difficult to estimate the time interval between death and discovery. The presence of odor and dessicated soft tissue suggest that the interval may have been less than two years and more than one month.

Trauma: Evidence for trauma at or about the time of death

consists of two perforations in the cranium. The first perforation appears to represent the entrance site of a round high-speed projectile. This circular perforation measures 8.6 mm in external surface diameter and is located 9 mm above the squamosal suture and about 34 mm posterior to the coronal suture. A fracture line extends anterior from this perforation, generally following the sphenotemporal suture. This fracture resulted in a partial separation of the squamosal portion of the right temporal. The internal surface of this perforation is considerably larger than its external surface.

The exit site of the projectile is located on the left parietal and consists of a large irregular opening measuring 41mm by 25mm just above the squamosal suture and including a small portion of the superior margin of the left temporal. The borders of this area are very irregular and are associated with considerable bone fragmentation. In addition, a section of bone measuring about 10 by 33 mm is missing from the associated posterior border of the left greater wing of the sphenoid. A fracture line 87 mm long extends from the posterior left squamosal suture to lambda. A second fracture line extends about 43 mm superior and posterior to the large opening on the left parietal. The left greater wing of the sphenoid is slightly separated from the temporal. In addition, the left malar is slightly separated from the left temporal at their common suture on the left zygomatic arch.

All of the trauma observed and noted above could be explained by the impact of a single high speed projectile at or about the time of death.

Identifying Characteristics: Note the dental restorations previously described. The individual also had a slight gap between the mandibular left canine and first premolar. The individual apparently had good dental care and displayed a slight maxillary overbite. A slight bony torus also occurs along the midline of the palate (roof of mouth). The individual had a small but rugged face with prominent nose.

MAR 17 1989

FIREARMS:

Specimen Q11 is a .32 caliber lead bullet which has been fired from a barrel rifled with ten grooves, right twist. The number, widths and direction of twist of the rifling impressions in the Q11 bullet are like those produced by the K1 revolver indicating that the Q11 bullet could have been fired from the K1 revolver. The Q11 bullet lacks sufficient individual microscopic marks of value for comparison purposes; therefore, it could not be determined if the Q11 bullet was fired from the K1 revolver to the exclusion of all other similarly rifled .32 caliber firearms.

As noted in the referenced December 15, 1981 report, the Q2 through Q7 cartridges are .32 S&W Long caliber cartridges of Remington manufacture. These cartridges are loaded with round-nosed lead bullets. The bullet was removed from one of these cartridges in the Laboratory, namely specimen Q7. It is noted that the Q11 bullet is similar in all its remaining observable physical characteristics to the bullet portion of the Q7 cartridge.

METALS ANALYSIS:

Specimen Q11 and the bullets from specimens Q2 through Q7 (11103049 S QV VB) were analyzed for their elemental composition by instrumental means.

Close compositional associations were found between specimen Q11 and the bullets of specimens Q2 and Q3. Bullets such as these are typically found within the same box of cartridges. It is pointed out that they can also be found in other boxes of cartridges, but it is most likely that these boxes would be produced by the same manufacturer on or about the same date.

For your information, it is not unusual to have more than one composition of bullets in a single box of ammunition.

MISCELLANEOUS:

The specimen Q10 skull was received in the FBI Laboratory January 14, 1988. A bullet was noted inside the skull. The bullet was removed and retained in the Laboratory while Anthropological examinations were being conducted. The bullet was then replaced inside the skull and returned to the investigating agency on April 20, 1988.

DISPOSITION:

The submitted specimens are being returned to your department under separate cover by air express.

Bullet
Lead-41-95-246207

Reference is made to FBI Laboratory report 11103049 S QV VB dated December 15, 1981, wherein specimens Q1 through Q7 and K1 have been previously described. Reference is ^{also} made to FBI Laboratory report 80114023 S VB ^{dated February 24, 1988,} wherein specimen Q10 was previously described.

81206010 QV

FIREARMS:

Specimen Q11 is a .32 caliber lead bullet which has been fired from a barrel rifled with ten grooves, right twist. The number, width and direction of twist of the rifling impressions in the Q11 bullet are like those produced by the K1 revolver indicating that the Q11 bullet could have been fired from the K1 revolver. The Q11 bullet lacks sufficient individual microscopic marks of value for comparison purposes; therefore, it could not be determined if the Q11 bullet was fired from the K1 revolver to the exclusion of all other similarly rifled .32 caliber firearms.

As noted in the referenced December 15, 1981 report, the Q2 through Q7 cartridges are .32 S & W Long caliber ^{of Remington manufacture} cartridges. These cartridges are loaded with round-nosed lead bullets. The bullet was removed from one of these cartridges in the Laboratory, namely specimen Q7. It is noted that the Q11 bullet is similar in all its remaining observable physical characteristics to the bullet portion of the Q7 cartridge.
